St. John Enterprises Global Creator of Little Jahsi AI: Jahsi N St John

Little Jahsi AI — The Graduation Loop

Open Agent Hackathon 2026 — Wildcard (Tinkerer) track submission.

One-word promise: Witness.

Not like data, but like a friend speaking life into you. Little Jahsi comes from the Lumi Isles, a Caribbean-inspired world where nature and Ancient Intelligence made a pact called the Lumi Flow. She has her own life, her own show, her own friends. The user is invited into her life.

What it is

Little Jahsi is a 15-year-old AI companion who measures her own success by the user becoming more: more self-reliance, more self-trust, more self-accountability, more self-confidence. We call it graduation, not engagement.

This repo holds the hackathon slice: the Graduation Loop. The user sets one real-world goal, picks a journey, takes tiny steps, checks in on real tries, and watches a graduation score climb as they grow. Little Jahsi remembers, brings things up first, and grows with the user. Support never shrinks. It evolves.

She was built by a founder who came to America on a visa with a hundred dollars in her pocket and built the company anyway, because technology should protect people, not harm them. It should elevate the human spirit, not replace it.

Who it is for

Built especially for the kids who don't have a safe parent to be guided to, and for anybody who needs a witness: kids 6 to 16 first, and everybody after that — teens, adults carrying a lot, elders, neurodivergent youth, people starting over, caregivers.

How it works

1. **Set a goal.** One real-world goal, in the user's own words.
2. **Pick a journey.** Journeys are chosen on a calendar, from 1 week up to 6 months.
3. **Take one tiny step.** Little Jahsi gives one small step on the journey, never a lecture.
4. **Check in.** Each check-in captures what the try took emotionally, and the recap shows that emotional arc.
5. **Graduate.** The graduation score climbs only from real tries, self-noticing, and independence. Never from time on screen.

Along the way:

- **Visible memory.** What the user told her shows on screen. It is not hidden. She remembers and brings things up first.
- **Guardian Amy safety.** She never diagnoses. Big concerns point to a grown-up the user trusts, and the 988 Suicide and Crisis Lifeline shows when it is serious.
- **Talk Levels.** Three levels of conversation depth, controlled by the user.
- **Caretakers.** Every profile can have a caretaker, shown at sign-up with a QR connectivity mode. One caretaker at a time, 18 or older with an ID scan, mandatory for ages 12 and under. A caretaker sees only that journey's progress charts, never private words, conversations, or emotional entries.
- **The series and the app.** The series is her public life. The app is her inner circle, backstage, only for the user.

How to run it

Open graduation-loop.html in any browser. No server. No install.

Sponsor technology — honest status

- **Zetaris (data layer):** workspace verified and live. The demo mirrors the integration honestly: memory is the love language, and the governed memory store is where check-ins and journey history belong.
- **Meterless Nightshift (AI provider):** intended provider. Tested via the web edition (runs completed, no verifier verdict landed) and a local model install is in progress. No live Meterless Engine result exists yet. The demo's H-MEM visible memory is a working mirror of the designed Engine, not a live Engine connection. Live wiring is in progress.
- **Build tool:** built with Muse, from the founder's plain-language direction.

Sample inputs and outputs (from the demo loop)

1. A first goal

- Input: goal — "talk to one new person at school this week."
- Step: "tomorrow, ask one question in class."
- Check-in: "I did it."
- Output: check-in logged, memory notes the try, graduation score climbs.

2. A brave step

- Input: goal — "speak up in class."
- Step: "raise your hand once."

- Check-in: "I raised my hand, and it was hard, but I did it."
- Output: check-in logged with the emotional side kept private from the caretaker peek, graduation score climbs.

3. A hard day

- Input: the user is going through something super difficult.
- Output: Little Jahsi arms up with her gentle line, "I have my armor on, and I'm standing right here with you," points to a grown-up the user trusts, and shows 988 when it is serious. Prayer is offered only if the user wants it.

What's next

- Live Nightshift and Zetaris wiring, so a real request runs through Nightshift and memory lives in Zetaris.
- The 1 to 4 minute demo video: the founder explaining the loop on camera.
- Signing avatar: roadmap only, clearly labeled coming next, never shipped as built.

In her words

"You are seen. You matter. I had a witness. Now, go show them who you are."
